

# DRONE DESIGN

Flying vehicles that don't have a pilot on board are known as DRONES. They can be flown by people on the ground, or by onboard computers. This makes them perfect for dangerous jobs in hard-to-reach areas.

Camera  
Drones can carry different attachments, depending on the job they need to do.

This drone is being used to help people after an **EARTHQUAKE**. What attachments could it have?

YOU COULD ADD...

Emergency medical supplies?

Flares to show rescuers where to go?

A fire extinguisher?

...OR OTHER THINGS YOU THINK WOULD HELP.

The drone below is being sent to explore a **VOLCANO**. Scribble on some useful attachments.

YOU COULD ADD...

Sensors to identify any gases being emitted?

A container to scoop up samples?

A thermometer?

...OR ANYTHING ELSE YOU CAN THINK OF.
