

It starts with a seed

Most plants grow from little seeds buried in the ground. Warmth, rain and sunshine makes the seeds swell and start to sprout.

How does it grow?

These pictures show different stages of a growing runner bean plant, but they're all mixed up. Can you add the numbers 1-8 in the circles to put them back in order?

Seeds to plants

Try to match these seeds to the fruits, vegetables and flowers they grow into.

How many grow?

Not all seeds that are planted will sprout and grow into plants, so gardeners will often sow more seeds than they need.

Count the tomato seeds here. Half of them start to grow. Of those that grow, a quarter will die before they're fully grown. And only half of those that finish growing will produce tomatoes. How many of the seeds will eventually grow tomatoes?

..... will grow tomatoes.
