

Symmetry

When both halves of a shape are the same, the shape is **symmetrical**. You can divide a symmetrical shape in half with a **mirror line**, or line of symmetry, like this:

These three friends have drawn a vertical mirror line on the grid below. Each of them has drawn half a shape along it. Draw the other half of their shapes for them, so that each shape is symmetrical.

My shape is an isosceles trapezium.

Mine is a kite.

Mine is an isosceles triangle.
