

THE EXAMINER

Thursday 21st October 2664

Killer Cream?

Dr Kettering's team uncover an AMAZING find.

Everything you were told in school is **WRONG**: The Examiner has uncovered **DRAMATIC** and **INCREDIBLE** new evidence about the extinction of the dinosaurs.

Up until now, scientists believed that the dinosaur population was wiped out after a "Mass Extinction Event", caused by a giant asteroid hitting the earth around 66 million years ago.

In an Examiner exclusive, we can reveal that this version of events is a load of old **RUBBISH**! A notebook belonging to the respected 21st century archaeologist Sheldon Kettering, has just been unearthed, and the contents are **SHOCKING**! In the notebook, Dr Kettering describes an archaeological dig in 2086 where he and his team uncovered an **AMAZING** find.

Wednesday August 14th, 2086

Bizarre discovery yesterday.

In among the bones of an Ichthyosaur was a custard cream biscuit. The computers have checked it out, and it is definitely a Triassic custard cream. This simply doesn't make any sense. After much discussion with Professor Corby, I have decided that rather than rethink our perfectly good theory as to how the dinosaurs died out, I am going to throw the custard cream away and pretend that I never saw it.

But could a packet of biscuits not invented until over 60 million years later really have wiped out the dinosaurs...? Was Sheldon Kettering trying to pull the biggest practical joke of all time? The answer remains a mystery. Perhaps we will never know the real truth, will we? Will we? Or will we?
